APM 70mm ED-APO Binocular

The APM 70mm ED-APO Binocular offers an exceptional level of binocular performance and is well suited to a variety of applications from Astronomy to Field Sports and Nature Observations.

At the heart of the binocular are its triplet lens assemblies, each featuring an FPL-51 low dispersion element. Combined with BAK 7 prisms and optical bench collimation up to 80x magnification, these binoculars are gauranteed to provide crystal clear views with a wide variety of eyepieces.

Included with each binocular are a pair of premium 18mm Ultra Flat Field (22x Magnification) eyepieces.

Practical features of the binoculars are the ease of transport thanks to their lightweight of only 3kg as a result of their splashproof, magnesium construction and integrated carrying handle. The handle may also be fitted with an optional red-dot finder for precise alignment in nightime applications. The extendable dew sheilds conveniently feature 77mm threads. This allows a wide variety of filters to be attached to either enhance views or simply protect the optics through use of an UV/IR cut filter.

For comfortable use, the interpupillary distance may be adjusted and focusing is achieved independent adjustment for each eye. Viewing comfort is further optimised for different applications with a choice of either 45° or 90° prism angles.
